Emmanuel Viennet

emmanuel.viennet@univ-paris13.fr

Graph : *review*

- *Number of nodes : N , number of edges (links) : L*
- *Neighbors of a node*
- *Incident link, indegree, outdegree*
- *path*
- *distance*
- *cycle*
- *connected*
- *tree*

Graph Traversal techniques

The previous connectivity problem, as well as many other graph problems, can be solved using *graph traversal techniques*

There are two standard graph traversal techniques:

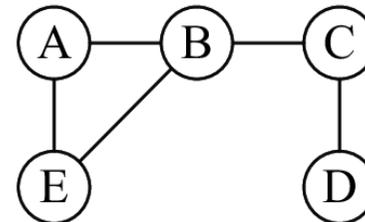

- *Depth-First Search* (DFS)
- *Breadth-First Search* (BFS)

Graph Traversal techniques (2)

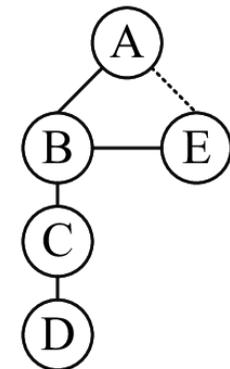

In both DFS and BFS, the nodes of the undirected graph are visited in a systematic manner so that **every node is visited exactly one**.

Both BFS and DFS give rise to a **tree**:

- When a node x is visited, it is labeled as visited, and it is added to the tree
- If the traversal got to node x from node y , y is viewed as the parent of x , and x a child of y

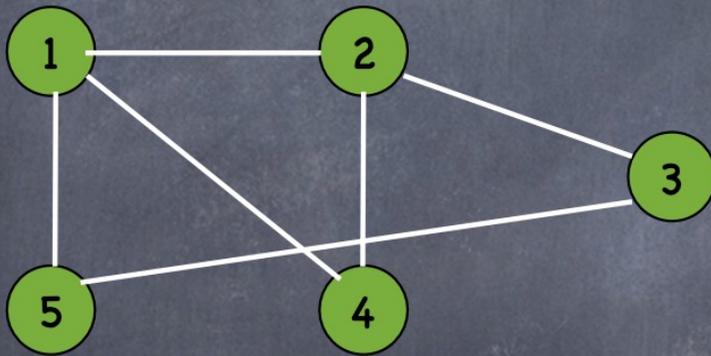

(a) undirected graph

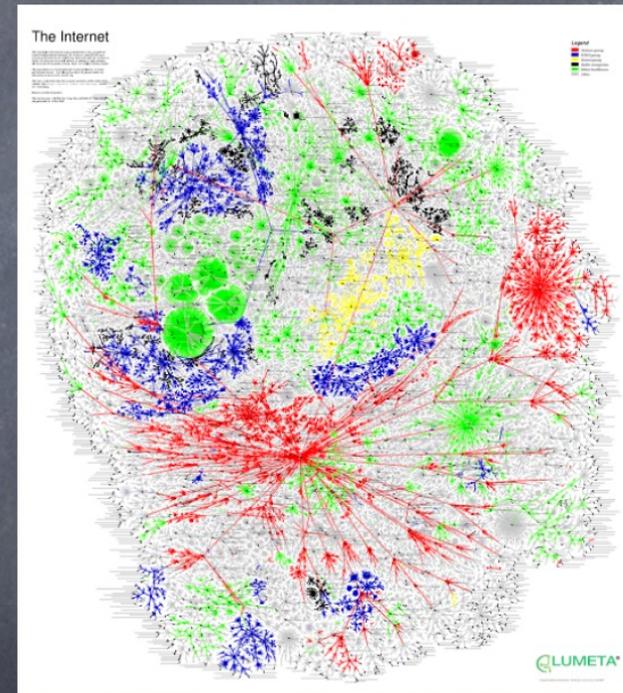

(b) DFS spanning tree

Graph Traversal

👁️ Is a graph connected?

easy

hmmm...

Graph Traversal

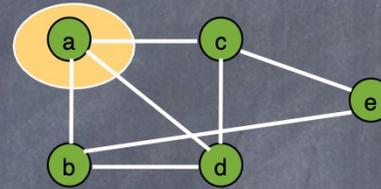

- Is a graph connected?
- Approach: explore outward from arbitrary starting node s to find all nodes reachable from s (**connected component**)

Graph Traversal

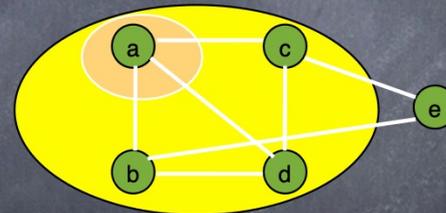

Is a Graph Connected?

- Algorithm 1: Breadth-first search (BFS)
Explore outward by distance

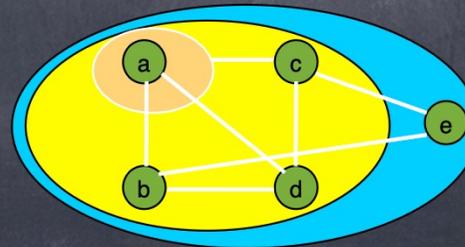

Start at a:

Visit all nodes at distance 1 from a:

Visit all nodes at distance 2 from a:

Breadth-First-Search (BFS)

Layers

- $L_0 = \{ s \}$.
- $L_1 =$ all neighbors of L_0
- $L_2 =$ nodes with edge to L_1 that do not belong to L_0 or L_1
- ...
- $L_{i+1} =$ nodes with edge to L_i that do not belong to an earlier layer

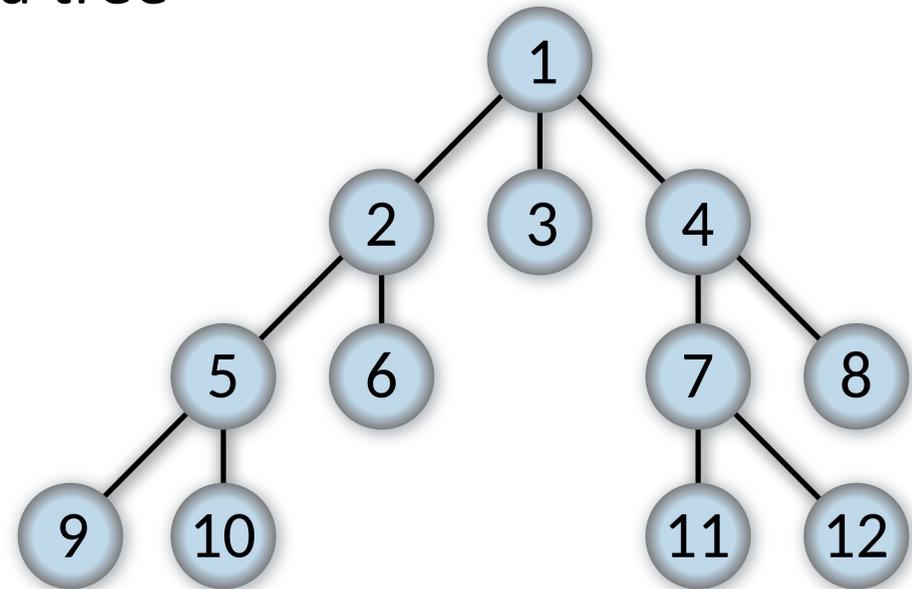

$$L_{i+1} = \{ v : \exists (u,v) \in E, u \in L_i, v \notin L_0 \cup \dots \cup L_i \}$$

Observation:

- L_i consists of all nodes at distance exactly i from s . There is a path from s to t iff t appears in some layer.

BFS Tree

If we keep only the edges traversed while doing a breadth-first-search, we will have a tree

https://en.wikipedia.org/wiki/Breadth-first_search

BFS pseudo-code

very similar to DFS, but use a Queue

```
1  procedure BFS(G, root) is  
2      let Q be a queue  
3      label root as explored  
4      Q.enqueue(root)  
5      while Q is not empty do  
6          v := Q.dequeue()  
7          if v is the goal then  
8              return v  
9          for all edges from v to w in G.adjacentEdges(v) do  
10             if w is not labeled as explored then  
11                 label w as explored  
12                 w.parent := v  
13                 Q.enqueue(w)
```

Depth-First Search (DFS)
